

Avantium expands the heterogeneous catalyst test capacity.

The third generation parallel fixed bed test reactor equipment launched last year will be expanded by additional test units. The test reactors will be used for testing of heterogeneous catalysts for refining applications. Avantium has used its experience in the refining area of the past years to further optimize the parallel catalyst test system. The test unit has provisions to be able to feed real feeds and properly handle and analyze the reactor effluent streams.

Hydrodesulfurization will be one of the capabilities of the new units. The system will be capable of studying sulfur removal levels well below 10ppm.
